

Fluoro Chemistry

The fluoro ploymer lowers the RI of coating and gives good optical transmittance

▶ UV-VIS-NIR Transmittance

Fluoropolymers are usually olefinic polymers which consist of partially or fully fluorinated monomers. New patented fluoro chemistry is incorporated to completely eliminate the formation of POFA and POFS even the degradation of coating in extreme environments without compromising desired optical properties such as low refractive index and high transmittance.

Our unique patented technology based on fluoro-siloxanepolymers is key to these demonstrated excellent properties.
